Présentation du projet

Cas d'utilisation

Exigences

Architecture matérielle

Architecture matérielle

Architecture logicielle

Fonctionnement global

Partie 1 : Capture et analyse de plaque

Partie 2 : IHM + Bases de données

Partie 3 : Géolocalisation + SMS

Partie 4 : Connectique et gestion du matériel

Fonctionnement global:

Fonctionnement global:

Architecture logicielle:

Conception:

mainCaptureAnalyse.cpp:

Conception:

gachette.cpp:

```
Gachette::Gachette()
    wiringPiSetup();
    portGachette = 29; // configuration du port GPIO d'ecoute du signal gachette
    gachettePression = 0;
    pinMode(portGachette, INPUT);
void Gachette::surveillerGachette()
    while (1)
        if (digitalRead(portGachette) == LOW && gachettePression == 0)
            std::cout << "Pression gachette" << std::endl;</pre>
            qachettePression = 1;
            break;
        if (digitalRead(portGachette) == HIGH)
            qachettePression = 0;
        delay(20);
```

Conception:

camera.cpp:

```
Camera::Camera()
    //set camera parameters
    m camera.set(CV CAP PROP FORMAT, CV 8UC1); //Format of the Mat objects returned by retrieve()
    nbImage = 7;
bool Camera::errorCheck()
    //Check if camera is opened
    if (!m camera.open())
        std::cerr << "Error opening the camera" << std::endl;</pre>
        return 1;
void Camera::prendrePhoto()
    std::cout << "Prise de la photo" << std::endl;</pre>
    for ( int i=0; i<nbImage; i++)</pre>
        m camera.grab(); // Grabs the next frame from capturing device
        m camera.retrieve(image); // Save the grabbed frame
    cv::imwrite("/home/pi/imagePlaque.jpg",image);
```

Conception:

reconnaissancePlaque.cpp:

```
std::string ReconnaissancePlaque::scanPlaque(std::string image)
   std::cout << "Analyse de l'image" << std::endl;
   alpr::AlprResults results = openalpr.recognize(image); // Recognize an image file.
   if (results.plates.size() == 0)
        return "Plague non lisible";
   alpr::AlprPlateResult plate = results.plates[0];
   alpr::AlprPlate candidate = plate.bestPlate;
   numeroPlaque = candidate.characters;
   for(unsigned int i = 0; i < numeroPlaque.size())</pre>
        if (numeroPlaque[i] == '0')numeroPlaque[i] = '0';
        if (numeroPlaque[i] == 'U')numeroPlaque[i] = 'V';
        if (numeroPlaque[i] == 'I') numeroPlaque[i] = '1';
        i++;
   std::cout << "Numero de plaque : " << numeroPlaque << std::endl;</pre>
   return numeroPlaque;
```
